```
-------------------------------------------------------------------------------
-- Example for CGI programming in Curry:
-- a form with a text input field and two event handlers
-------------------------------------------------------------------------------

import HTML

main :: IO HtmlForm
main = return $ form "Question"
           [htxt "Enter a string: ", textfield tref "", hrule,
            button "Reverse string"   revhandler,
            button "Duplicate string" duphandler]

 where
  tref free

  revhandler env = return $ form "Answer"
           [h1 [htxt $ "Reversed input: " ++ reverse (env tref)]]

  duphandler env = return $ form "Answer"
           [h1 [htxt $ "Duplicated input: " ++ env tref ++ env tref]]

-- Install the CGI program by:
-- makecurrycgi revdup
```
